A guessing jar: How many marbles? 223!

A classic game

A guessing jar: How many marbles? 223!

1. What's the largest number of marbles that can fit in the container?

A classic game

A guessing jar: How many marbles? 223!

1. What's the largest number of marbles that can fit in the container?
2. Given 223 marbles, what's the smallest container holding them all?

A classic game

A guessing jar: How many marbles? 223!

1. What's the largest number of marbles that can fit in the container?
2. Given 223 marbles, what's the smallest container holding them all?

We need to simplify the problem...

Number
Theory

Clyde
Kertzer

Corollary

If three mutually tangent circles have curvatures a , b , and c , then the two circles of Apollonius, d and d' have curvatures

$$d = a + b + c + 2\sqrt{ab + ac + bc}$$

$$d' = a + b + c - 2\sqrt{ab + ac + bc}$$

The Descartes Equation

Corollary

If three mutually tangent circles have curvatures a , b , and c , then the two circles of Apollonius, d and d' have curvatures

$$d = a + b + c + 2\sqrt{ab + ac + bc}$$

$$d' = a + b + c - 2\sqrt{ab + ac + bc}$$

The Key Relation

The Descartes Equation

Corollary

If three mutually tangent circles have curvatures a , b , and c , then the two circles of Apollonius, d and d' have curvatures

$$d = a + b + c + 2\sqrt{ab + ac + bc}$$

$$d' = a + b + c - 2\sqrt{ab + ac + bc}$$

The Key Relation

$$d + d' = 2(a + b + c)$$

The Descartes Equation

Corollary

If three mutually tangent circles have curvatures a , b , and c , then the two circles of Apollonius, d and d' have curvatures

$$d = a + b + c + 2\sqrt{ab + ac + bc}$$

$$d' = a + b + c - 2\sqrt{ab + ac + bc}$$

The Key Relation

$$d + d' = 2(a + b + c) \implies d' = 2(a + b + c) - d$$

Number
Theory

Clyde
Kertzer

Proof.

The Descartes Equation

Packing
Problems &
Number
Theory

Clyde
Kertzer

Proof.

First, we solve for d from the Descartes Equation to find that

The Descartes Equation

Proof.

First, we solve for d from the Descartes Equation to find that

$$2(a^2 + b^2 + c^2 + d^2) - (a + b + c + d)^2 = 0$$
$$d^2 - 2d(a + b + c) + (a^2 + b^2 + c^2 - 2ab - 2bc - 2ac) = 0.$$

The Descartes Equation

Proof.

First, we solve for d from the Descartes Equation to find that

$$2(a^2 + b^2 + c^2 + d^2) - (a + b + c + d)^2 = 0$$
$$d^2 - 2d(a + b + c) + (a^2 + b^2 + c^2 - 2ab - 2bc - 2ac) = 0.$$

The quadratic formula gives

The Descartes Equation

Proof.

First, we solve for d from the Descartes Equation to find that

$$\begin{aligned}2(a^2 + b^2 + c^2 + d^2) - (a + b + c + d)^2 &= 0 \\d^2 - 2d(a + b + c) + (a^2 + b^2 + c^2 - 2ab - 2bc - 2ac) &= 0.\end{aligned}$$

The quadratic formula gives

$$\begin{aligned}d &= (a + b + c) \\&\quad \pm \frac{\sqrt{4(a + b + c)^2 - 4(a^2 + b^2 + c^2 - 2ab - 2bc - 2ac)}}{2} \\&= a + b + c \pm 2\sqrt{ab + bc + ca}.\end{aligned}$$

The Descartes Equation

Proof.

First, we solve for d from the Descartes Equation to find that

$$\begin{aligned}2(a^2 + b^2 + c^2 + d^2) - (a + b + c + d)^2 &= 0 \\d^2 - 2d(a + b + c) + (a^2 + b^2 + c^2 - 2ab - 2bc - 2ac) &= 0.\end{aligned}$$

The quadratic formula gives

$$\begin{aligned}d &= (a + b + c) \\&\pm \frac{\sqrt{4(a + b + c)^2 - 4(a^2 + b^2 + c^2 - 2ab - 2bc - 2ac)}}{2} \\&= a + b + c \pm 2\sqrt{ab + bc + ca}.\end{aligned}$$

Thus, there are two options for d . Their sum is $2(a + b + c)$. □

Corollary

A natural number n has $2^{\omega(n)-1}$ sum-symmetric packings, where $\omega(n)$ is the number of distinct prime divisors of n .

The Number of Sum-Symmetric Packings

Corollary

A natural number n has $2^{\omega(n)-1}$ sum-symmetric packings, where $\omega(n)$ is the number of distinct prime divisors of n .

Proof.

The Number of Sum-Symmetric Packings

Corollary

A natural number n has $2^{\omega(n)-1}$ sum-symmetric packings, where $\omega(n)$ is the number of distinct prime divisors of n .

Proof.

Because $n = -xy$ determines the sum-symmetric packing for coprime x and y , write $n = p_1^{e_1} p_2^{e_2} \cdots p_k^{e_k}$, so $\omega(n) = k$.

The Number of Sum-Symmetric Packings

Corollary

A natural number n has $2^{\omega(n)-1}$ sum-symmetric packings, where $\omega(n)$ is the number of distinct prime divisors of n .

Proof.

Because $n = -xy$ determines the sum-symmetric packing for coprime x and y , write $n = p_1^{e_1} p_2^{e_2} \cdots p_k^{e_k}$, so $\omega(n) = k$. For each prime power we can choose to put it as a factor of x or y ,

The Number of Sum-Symmetric Packings

Corollary

A natural number n has $2^{\omega(n)-1}$ sum-symmetric packings, where $\omega(n)$ is the number of distinct prime divisors of n .

Proof.

Because $n = -xy$ determines the sum-symmetric packing for coprime x and y , write $n = p_1^{e_1} p_2^{e_2} \cdots p_k^{e_k}$, so $\omega(n) = k$. For each prime power we can choose to put it as a factor of x or y , so there 2^k total factor pairs xy

The Number of Sum-Symmetric Packings

Corollary

A natural number n has $2^{\omega(n)-1}$ sum-symmetric packings, where $\omega(n)$ is the number of distinct prime divisors of n .

Proof.

Because $n = -xy$ determines the sum-symmetric packing for coprime x and y , write $n = p_1^{e_1} p_2^{e_2} \cdots p_k^{e_k}$, so $\omega(n) = k$. For each prime power we can choose to put it as a factor of x or y , so there 2^k total factor pairs xy but we divide by two to account for symmetry.

The Number of Sum-Symmetric Packings

Corollary

A natural number n has $2^{\omega(n)-1}$ sum-symmetric packings, where $\omega(n)$ is the number of distinct prime divisors of n .

Proof.

Because $n = -xy$ determines the sum-symmetric packing for coprime x and y , write $n = p_1^{e_1} p_2^{e_2} \cdots p_k^{e_k}$, so $\omega(n) = k$. For each prime power we can choose to put it as a factor of x or y , so there 2^k total factor pairs xy but we divide by two to account for symmetry. Thus, n has $2^k/2 = 2^{k-1} = 2^{\omega(n)-1}$ sum-symmetric packings. □

Sum-Symmetric packings of 60

Packing
Problems &
Number
Theory

Clyde
Kertzer

Write $60 = 2^2 \cdot 3 \cdot 5$,

Sum-Symmetric packings of 60

Write $60 = 2^2 \cdot 3 \cdot 5$, so 60 has $2^{3-1} = 2^2 = 4$ sum-symmetric packings.

Sum-Symmetric packings of 60

Write $60 = 2^2 \cdot 3 \cdot 5$, so 60 has $2^{3-1} = 2^2 = 4$ sum-symmetric packings.
These correspond to the coprime factor pairs

Sum-Symmetric packings of 60

Write $60 = 2^2 \cdot 3 \cdot 5$, so 60 has $2^{3-1} = 2^2 = 4$ sum-symmetric packings.
These correspond to the coprime factor pairs $(1, 60)$,

Sum-Symmetric packings of 60

Write $60 = 2^2 \cdot 3 \cdot 5$, so 60 has $2^{3-1} = 2^2 = 4$ sum-symmetric packings.
These correspond to the coprime factor pairs $(1, 60)$, $(4, 15)$,

Sum-Symmetric packings of 60

Write $60 = 2^2 \cdot 3 \cdot 5$, so 60 has $2^{3-1} = 2^2 = 4$ sum-symmetric packings.
These correspond to the coprime factor pairs $(1, 60)$, $(4, 15)$, $(3, 20)$,

Sum-Symmetric packings of 60

Write $60 = 2^2 \cdot 3 \cdot 5$, so 60 has $2^{3-1} = 2^2 = 4$ sum-symmetric packings.

These correspond to the coprime factor pairs $(1, 60)$, $(4, 15)$, $(3, 20)$, $(5, 12)$.

Sum-Symmetric packings of 60

Write $60 = 2^2 \cdot 3 \cdot 5$, so 60 has $2^{3-1} = 2^2 = 4$ sum-symmetric packings.

These correspond to the coprime factor pairs $(1, 60)$, $(4, 15)$, $(3, 20)$, $(5, 12)$. They are

$$(1, 60) \implies [-60, 61, 3660, 3661]$$

$$(4, 15) \implies [-60, 76, 285, 301]$$

$$(3, 20) \implies [-60, 69, 460, 469]$$

$$(5, 12) \implies [-60, 85, 204, 229]$$

Twin-Symmetric Packings

Further improved to:

Theorem

A twin-symmetric quadruple is one of following two forms

$$\begin{cases} \left[-xy, xy + 2y^2, \frac{1}{2}(x+y)^2, \frac{1}{2}(x+y)^2 \right] & x, y \text{ odd} & x > y \\ \left[-2xy, 2xy + 4y^2, (x+y)^2, (x+y)^2 \right] & xy \text{ even} & x > y \end{cases}$$

with $\gcd(x, y) = 1$ and $x, y \geq 0$.

Twin-Symmetric Packings

Further improved to:

Theorem

A twin-symmetric quadruple is one of following two forms

$$\begin{cases} [-xy, xy + 2y^2, \frac{1}{2}(x+y)^2, \frac{1}{2}(x+y)^2] & x, y \text{ odd} & x > y \\ [-2xy, 2xy + 4y^2, (x+y)^2, (x+y)^2] & xy \text{ even} & x > y \end{cases}$$

with $\gcd(x, y) = 1$ and $x, y \geq 0$.

Ex: $x = 3, y = 2$

Twin-Symmetric Packings

Further improved to:

Theorem

A twin-symmetric quadruple is one of following two forms

$$\begin{cases} [-xy, xy + 2y^2, \frac{1}{2}(x+y)^2, \frac{1}{2}(x+y)^2] & x, y \text{ odd} & x > y \\ [-2xy, 2xy + 4y^2, (x+y)^2, (x+y)^2] & xy \text{ even} & x > y \end{cases}$$

with $\gcd(x, y) = 1$ and $x, y \geq 0$.

Ex: $x = 3, y = 2$:

$$[-12, 12 + 16, 5^2, 5^2] \implies [-12, 28, 25, 25]$$

Twin-Symmetric Packings

Further improved to:

Theorem

A twin-symmetric quadruple is one of following two forms

$$\begin{cases} [-xy, xy + 2y^2, \frac{1}{2}(x+y)^2, \frac{1}{2}(x+y)^2] & x, y \text{ odd} & x > y \\ [-2xy, 2xy + 4y^2, (x+y)^2, (x+y)^2] & xy \text{ even} & x > y \end{cases}$$

with $\gcd(x, y) = 1$ and $x, y \geq 0$.

Ex: $x = 3, y = 2$:

$$[-12, 12 + 16, 5^2, 5^2] \implies [-12, 28, 25, 25]$$

Why won't $x = 1, y = 3$ work?

Twin-Symmetric Packings

Further improved to:

Theorem

A twin-symmetric quadruple is one of following two forms

$$\begin{cases} [-xy, xy + 2y^2, \frac{1}{2}(x+y)^2, \frac{1}{2}(x+y)^2] & x, y \text{ odd} & x > y \\ [-2xy, 2xy + 4y^2, (x+y)^2, (x+y)^2] & xy \text{ even} & x > y \end{cases}$$

with $\gcd(x, y) = 1$ and $x, y \geq 0$.

Ex: $x = 3, y = 2$:

$$[-12, 12 + 16, 5^2, 5^2] \implies [-12, 28, 25, 25]$$

Why won't $x = 1, y = 3$ work? Let's try:

Twin-Symmetric Packings

We define δ_n as

$$\delta_n = \begin{cases} 1 & n \equiv 2 \pmod{4} \\ 0 & \text{otherwise.} \end{cases}$$

The Number of Twin-symmetric Packings

We define δ_n as

$$\delta_n = \begin{cases} 1 & n \equiv 2 \pmod{4} \\ 0 & \text{otherwise.} \end{cases}$$

Corollary

The Number of Twin-symmetric Packings

We define δ_n as

$$\delta_n = \begin{cases} 1 & n \equiv 2 \pmod{4} \\ 0 & \text{otherwise.} \end{cases}$$

Corollary

A natural number n has $(1 - \delta_n) \cdot 2^{\omega(n)-1}$ twin-symmetric packings where $\omega(n)$ is the number of distinct prime divisors of n .
